Company description

The revolution of Smart Lighting!

Decrease consumption while maintaining safety and visual comfort !

Thanks to SmartNodes smart lighting modules, it is now possible to reverse the modalities of public lighting! Instead of illuminating everywhere at full power during the whole night, lamps are kept to a minimal output level, except when road users are present.

This brings many benefits: drastic decrease of consumed power, light pollution and ecological footprint of the lighting system. Moreover, this is achieved while maintaining the visual comfort and safety of each person present in the public space.

With SmartNodes, smart lighting enters a new era !

Based on the decentralised wireless network, additional sensors are hooked up to the system. Thus a real smart city grid is available in the public space. Additional solutions comprise; traffic management, noise and air quality analysis. Other solutions are in development.
